- 1.113.1 Configure and manage inetd, xinetd, and related services [4]
- 1.113.2 Operate and perform basic configuration of sendmail [4]
- 1.113.3 Operate and perform basic configuration of Apache [4]
- 1.113.4 **Properly manage the NFS, smb, and nmb daemons [4]**
- 1.113.5 Setup and configure basic DNS services [4]
- 1.113.7 Set up secure shell (OpenSSH) [4]

# Description of Objective

## 1.113.4 Properly manage the NFS, smb, and nmb daemons

1.113.4  
Properly manage the  
NFS, smb, and nmb  
daemons  
Weight 4

Andrew Eager

Candidate should know how to mount remote filesystems using NFS, configure NFS for exporting local filesystems, start, stop, and restart the NFS server. Install and configure Samba using the included GUI tools or direct edit of the `/etc/smb.conf` file (Note: this deliberately excludes advanced NT domain issues but includes simple sharing of home directories and printers, as well as correctly setting the `nmbd` as a WINS client).

# Properly manage the NFS, smb, and nmb daemons

## Resources

**NFS:** <http://nfs.sourceforge.net/>

**Samba:** <http://au1.samba.org/samba/docs/>

- ▶ Especially important are the two online books:
  - ▶ <http://au1.samba.org/samba/docs/man/Samba3-HOWTO/>, and
  - ▶ <http://au1.samba.org/samba/docs/man/Samba3-ByExample/>

1.113.4

Properly manage the  
NFS, smb, and nmb  
daemons

- ▶ “Network File System”
- ▶ Extremely widely used protocol for sharing files between Unix machines
- ▶ Built over RPC
- ▶ Almost always uses UDP
- ▶ Unlike alternatives, the NFS protocol is **stateless**—the server can reboot and the client carries on
- ▶ NFSv2 is very simple; v3 is an evolution of v2; v4 is complex (and stateful)

# NFS

## Client-side usage

```
mount -o options server:/path /mnt_point

# typical /etc/fstab line - see nfs(5)
server:/exports/home /home nfs rw,intr,rsize=8192,wsizes=8192
```

### Some options:

- rsize/wsizes** Read/write size
- intr** Allow signals to interrupt timed-out operations
- soft** Don't retry indefinitely

1.113.4

Properly manage the  
NFS, smb, and nmb  
daemons

# NFS

## Server-side configuration

`/etc/exports` controls what gets exported to where

```
# /etc/exports.  See exports(5)
/home    10.0.128.0/24(rw,no_root_squash)
/cdrom   *(ro,all_squash)
```

Information is actually communicated to mountd and kernel NFS server via **exports(8)**

**Note:** No whitespace is allowed between client and client options  
(**showmount(8)** will query this information from a server)

1.113.4

Properly manage the  
NFS, smb, and nmb  
daemons  
Weight 4

- ▶ Implementation of Windows networking protocols (SMB/CIFS, NMB) for Unix
- ▶ Samba version 3 (just released) gives PDC/BDC functionality, NT4 domain member support, much improved printing, etc
- ▶ Full suite of tools, including smbd and nmbd daemons, but also client tools: smbclient, rpcclient, net, smbstatus, nmblookup, smbtar, smbpool, etc

Configured through `/etc/samba/smb.conf`  
win.ini-esque sections describing shares

```
[public]
comment = Public files
path = /home/ftp/pub
read only = yes
guest ok = yes
```

Various %X string substitutions available (see smb.conf(5))

# Samba

## smb.conf – Special sections

[global] Global configuration

[homes] Triggers creation of automatic user home directory shares

[printers] Triggers creation of printer shares for each system printer

1.113.4

Properly manage the  
NFS, smb, and nmb  
daemons

- ▶ “Samba Web Administration Tool”
- ▶ Usual install is `http://localhost:901/`
- ▶ Easy to use, links to relevant documentation, etc.
- ▶ Rewrites `smb.conf`, loses comments, reorders and destroys hand crafted directives such as `include`
